Computed Tomography
Perfusion Imaging
Policy Number: HS-161

Original Effective Date: 3/18/2010
Revised Date(s): 3/18/2011; 3/1/2012

DISCLAIMER
The Clinical Coverage Guideline is intended to supplement certain standard WellCare benefit plans. The terms of a member’s particular Benefit Plan, Evidence of Coverage, Certificate of Coverage, etc., may differ significantly from this Coverage Position. For example, a member’s benefit plan may contain specific exclusions related to the topic addressed in this Clinical Coverage Guideline. When a conflict exists between the two documents, the Member’s Benefit Plan always supersedes the information contained in the Clinical Coverage Guideline. Additionally, Clinical Coverage Guidelines relate exclusively to the administration of health benefit plans and are NOT recommendations for treatment, nor should they be used as treatment guidelines. The application of the Clinical Coverage Guideline is subject to the benefit determinations set forth by the Centers for Medicare and Medicaid Services (CMS) National and Local Coverage Determinations and state-specific Medicaid mandates, if any.

APPLICATION STATEMENT
The application of the Clinical Coverage Guideline is subject to the benefit determinations set forth by the Centers for Medicare and Medicaid Services (CMS) National and Local Coverage Determinations and state-specific Medicaid mandates, if any.
BACKGROUND

Computed tomography (CT) perfusion imaging provides a quantitative measurement of regional cerebral blood flow. A perfusion CT study involves sequential acquisition of CT sections during intravenous administration of an iodinated contrast agent. Analysis of the results allows the physician to calculate the regional cerebral blood volume, the blood mean transit time through the cerebral capillaries, and the regional cerebral blood flow. CT perfusion imaging has been proposed to be used primarily as a method of evaluating patients suspected of having an acute stroke whenever thrombolysis is considered. CT perfusion imaging may provide information about the presence and site of vascular occlusion, the presence and extent of ischemia, and about tissue viability. This information may help the clinician determine whether thrombolysis is appropriate.

Perfusion computed tomography imaging tracks transient attenuation changes in the blood vessels and brain parenchyma during the first pass passage of an intravenously injected contrast medium. Maps of cerebral blood volume, mean transit time, and cerebral blood flow can be obtained from a pixel-by-pixel analysis of the density changes over time. The maps generated depend on the commercial software and algorithms used in the processing of the data. Currently, there are three perfusion CT approaches that use different data acquisition and analysis methods:

- Whole brain CT perfused blood volume – Whole brain CT perfused blood volume is assessed by acquiring a helical scan through the whole brain with and without contrast
- First pass perfusion CT – A first pass or bolus tracking CT perfusion study is performed by acquiring repeated images at the same location (a cine scan) through a volume of interest during bolus injection and passage of contrast through the region of interest
- Dynamic perfusion CT – Acquiring a temporal set of images through an extended volume of interest during a bolus injection of contrast constitutes a dynamic perfusion CT study. In this context, the extended volume of interest refers to imaging of tissue beyond the absolute width of the detector array

Due to the paucity of evidence regarding cerebral CT perfusion imaging, the technique is considered experimental and investigational. There are no clear data showing improved outcomes compared to standard non-contrast CT scanning.

POSITION STATEMENT

Computed tomography (CT) perfusion imaging is considered experimental and investigational for assessing members suspected of having an acute stroke or in triaging members with stroke for thrombolytic therapy.

CT perfusion imaging is considered experimental and investigational for evaluating members with the following indications:

- 437.0 Chronic cerebral ischemia; OR,
- 435.9 Cerebral vasospasm; OR,
- 854.0 Head trauma; OR,
- 191.0 Cerebral gliomas; OR,
- 054.3 Herpes simplex virus encephalitis; OR,
- Use in balloon occlusion tests; OR,
- Any and all other possible indications.
